FAMILY F · VISUAL & REFERENCE

Architecture Diagrams

Visual companion to the Equator Resolution documentation set — system context, layers, services, lifecycle, flows, deployment and data.

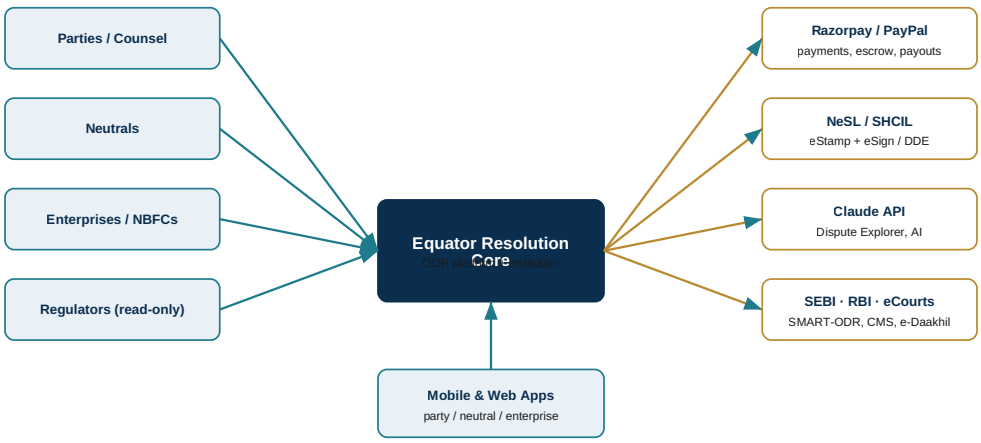

Document EQR-16 · Version 2.0 · 8 July 2026 · Confidential — Internal · Companion to EQR-01, EQR-02, EQR-06, EQR-12

Contents

1. 1 · System Context
2. 2 · Layered Architecture
3. 3 · Microservices Map
4. 4 · Case Lifecycle State Machine
5. 5 · The Resolution Ladder
6. 6 · Company Complaint-to-Escalation Flow
7. 7 · Dispute Explorer (AI) Flow
8. 8 · Payments, Escrow & Payout
9. 9 · Deployment Topology
10. 10 · High-level Entity-Relationship (core)

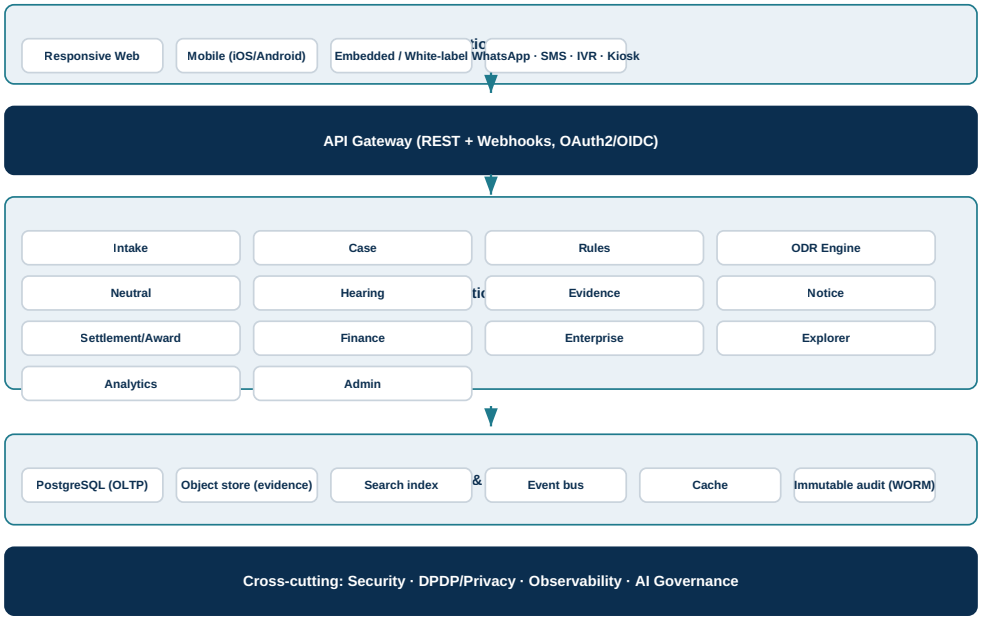

1 · System Context

Who and what the platform connects to: user personas (left), external systems and rails (right), and the client apps (bottom).

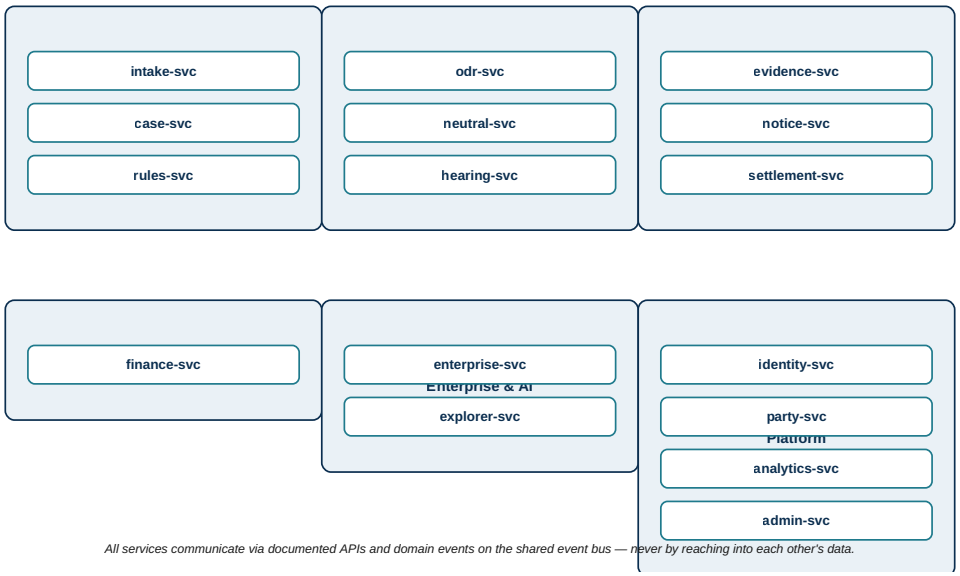

2 · Layered Architecture

Channels flow through one API gateway to bounded application services over a shared data & platform layer, with security, privacy, observability and AI governance cutting across every layer.

3 · Microservices Map

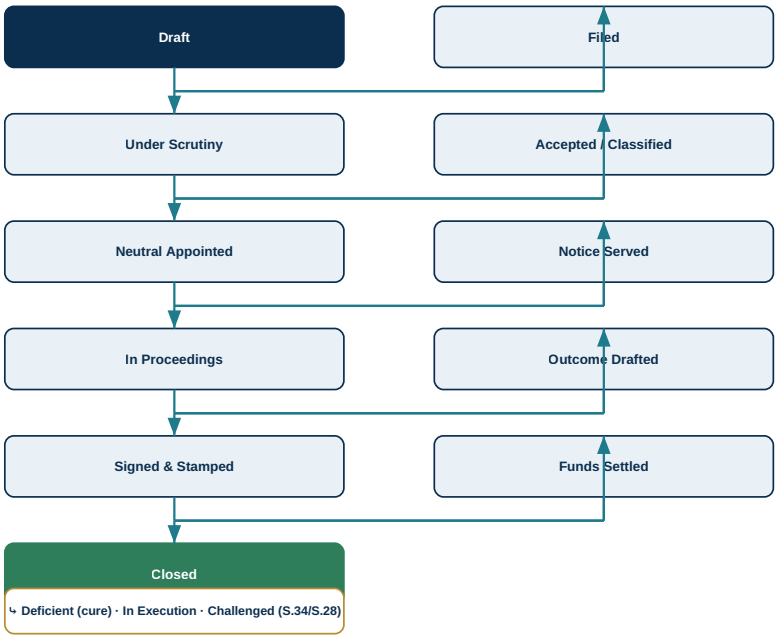

The application services grouped by concern. Each is independently deployable and stateless where possible.

All services communicate via documented APIs and domain events on the shared event bus — never by reaching into each other's data.

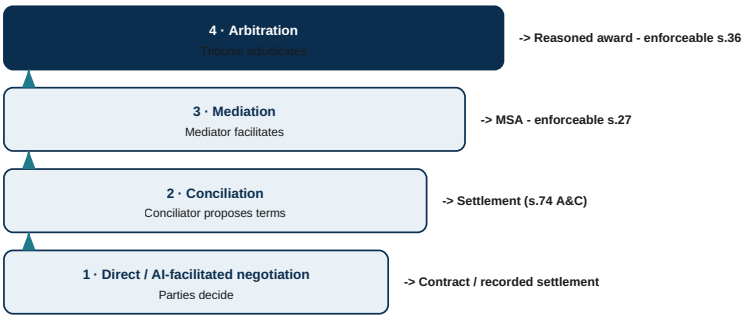

4 · Case Lifecycle State Machine

The canonical case states. Each transition emits a domain event and may start or stop a compliance clock; side-states handle deficiency cure, execution and challenge.

5 · The Resolution Ladder

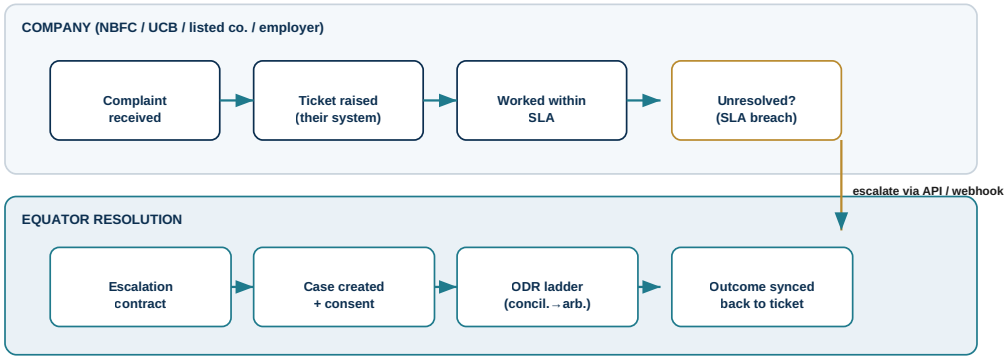

Four methods on one engine, differentiated by who decides and how the outcome is enforced.

Parties climb only as far as the dispute requires; a matter can enter at any allowed rung and settle at any rung.

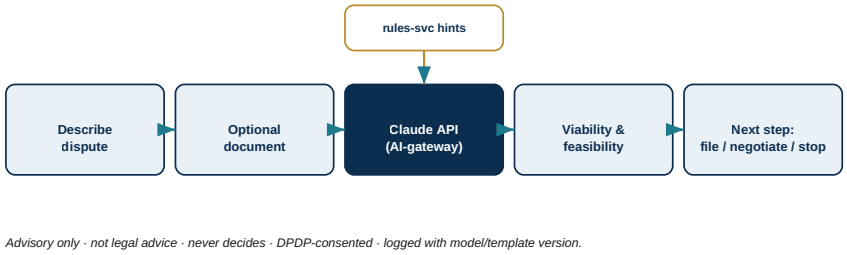

6 · Company Complaint-to-Escalation Flow

A company resolves in-house first; on SLA breach the ticket escalates to Equator via API, becomes a case, and the outcome syncs back.

7 · Dispute Explorer (AI) Flow

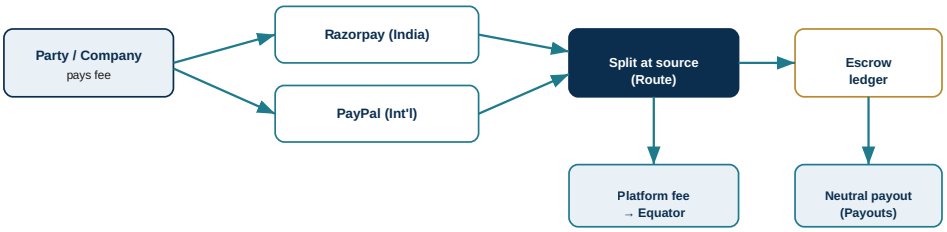

The pre-litigation consultation: guided intake, optional document extraction, a grounded Claude call, and a viability read with a recommended next step.

Advisory only · not legal advice · never decides · DPDP-consented · logged with model/template version.

8 · Payments, Escrow & Payout

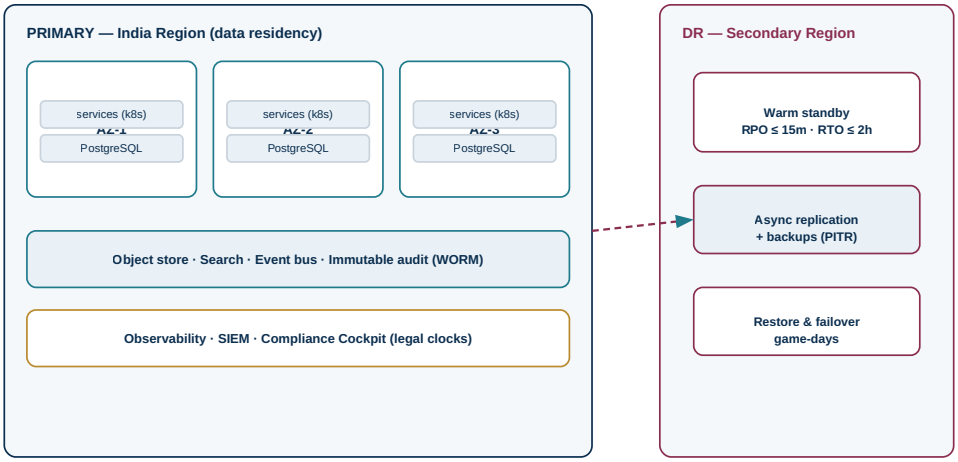

One party payment is split at source into the neutral's fee and the platform fee; settlement money escrows and releases on performance; neutrals are paid out on the matching rail.

Settlement funds held in escrow release on performance; neutral fee disposed via Razorpay/PayPal Payouts; TDS/GST applied.

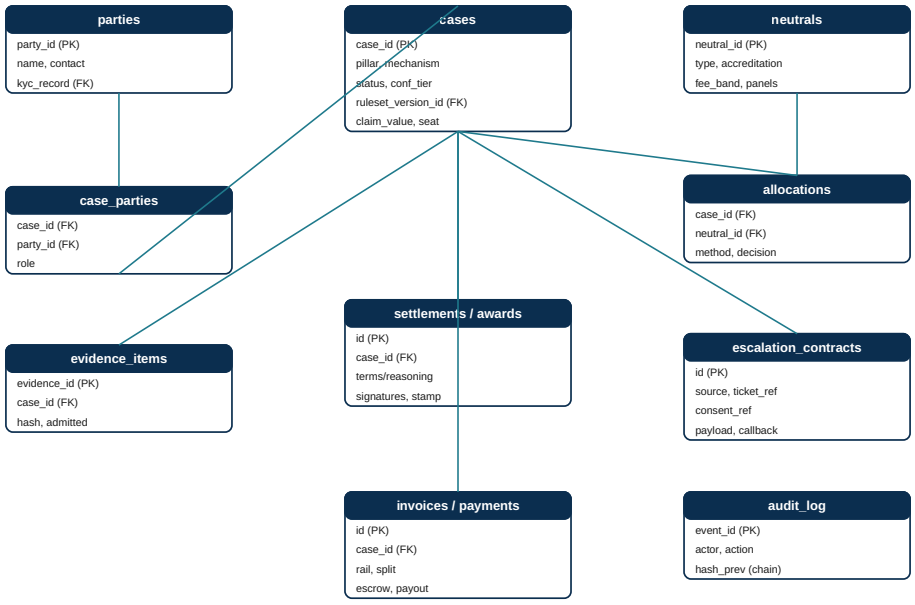

9 · Deployment Topology

Core services run across three availability zones in an Indian region for residency and resilience; a warm secondary region provides disaster recovery with strict RPO/RTO.

10 · High-level Entity-Relationship (core)

The core case aggregate and its neighbours. Full field-level schema is in EQR-12.
